

Introducing Modeling Glass™

Modeling Glass transforms powdered glass into a firm, non-sticky material like clay! No molds or freezing required.

Modeling Glass is a new product that has been in development for several years at Glass Bird Studios. It's a unique two-part kit consisting of a powdered binder and liquid medium that artists combine with water and their own powdered glass or frit. The resulting material has the consistency of clay, is smooth and easy to work with. It won't stick to your hands or tools. The binder and liquid medium are food-grade and non-toxic.

You can work with Modeling Glass in many of the same ways you would work with clay: roll into coils, roll into a flat sheet and cut out shapes, or press into silicone molds. Modeling Glass holds its shape without freezing. When fired to tack-fuse temperatures it will hold an amazing amount of textural detail. It can be thinned with water and used to create beautiful palette-knife textures. Combine colors to make your own blends.

Before firing, dry Modeling Glass shapes can be sanded, carved, and otherwise modified, virtually eliminating the need for extensive cold working after firing.

During firing, the binder and medium will burn away, and do not affect the compatibility of the glass. It can be used with either COE 90 or 96 glass, and at full-fuse temperatures, colors remain true.

Each kit makes over 3 pounds of Modeling Glass and comes with complete instructions for mixing, use, storage, and a suggested basic firing schedule. Modeling Glass is easy to use and gives artists a whole new way to work with hand-sculpted shapes!

Individual larger refill sizes are also available!

ORDERING MODELING GLASS:
Glass Bird Studios only sells Modeling Glass wholesale to retail vendors.
Minimum order is 12 units. Please ask your local glass product retailer to order some Modeling Glass!

- Non-toxic, food-grade ingredients
- Compatible with all glass COE
- Colors fire true
- Individual larger refill sizes also available
- Starter Kit makes over 3 pounds of Modeling Glass
- Use your own frit powders
